Institute for Health and Society

The Medical College of Wisconsin’s (MCW) Institute for Health and Society is focused on developing the next generation of scholars who integrate public health, bioethics and biostatistics with community health.

The MCW Institute for Health and Society features innovative graduate programs for students looking to blend the art and science of public health, bioethics and biostatistics with improving the health and wellness of populations in their community and the world.
PUBLIC & COMMUNITY HEALTH (PhD)

The Public & Community Health program at MCW is an ideal choice if you are interested in engaging with community partners and academians to build healthier societies. The purpose of the program is to transform the research paradigm in public and community health by educating the next generation of innovative scholars, who will integrate the rigors of traditional public health sciences with the essential components of community health improvement, through participation and partnership. Through relevant coursework, comprehensive programs in research, and service, you will acquire the knowledge and skills required to assume leadership roles in public health and academia.

BIOSTATISTICS (PhD)

The PhD Program in Biostatistics at MCW is designed to educate students in biostatistical methodology, theory and practice. Our program takes an average of five-years to complete, and includes a fellowship within your first 18-months of study. Upon graduating from the program, you could follow in the footsteps of many of our alumni, who are teaching at major universities or working in critical roles in industry and the government.

PUBLIC HEALTH (MPH)

MCW’s MPH program is geared for busy professionals like you looking to take your current career to the next level. In fact, most of our students have full-time careers and responsibilities outside of their coursework. That’s why we designed our completely online program to be flexible, to help you to succeed. Coursework typically requires 6-10 hours per week, and you will need to complete one or two courses each semester in order to complete the program within the allowed five-year time frame. The program also offers a 15-credit Graduate Certificate in Public Health, a 12-credit Certificate in Population Health Management and a 12-credit Certificate in Community Health Assessment and Planning.

BIOETHICS (MA)

MCW’s Bioethics program is focused on helping physicians and health care institutions analyze and resolve difficult ethical issues that arise at the bedside in individual patient cases. Additionally, we devote significant effort to normative and empirical scholarship on key bioethical issues of regional, national and international importance; educating the next generation of bioethicists, medical students, residents and fellows at MCW and affiliated institutions; and consultation and outreach to civic, health care, and professional organizations and policy makers throughout the U.S. The program also offers a 12-credit certificate in Clinical Bioethics.
